

This is the system diagram for the body projection mapping system. This system also contains a Poll system that allows the audience to have an influence on the projections at a live performance. This system diagram was not used in my final prototype.

The system diagram that was used did not contain any Poll system and only uses a sensor that sends that data to a computer. This data then gets used to define the skeleton data in a program and then the animations get placed on top of this skeleton. In the end, all of these animations will then be projected on the performer or on the projector screen.
